

DEMO REPORT

Excretory

An organism's excretory system is a passive biological mechanism that helps maintain chemical equilibrium inside the body and protects it from injury by removing excess, unwanted materials. Waste products of metabolism and consumed and broken down components may be removed from the body through excretory systems in both a liquid and gaseous form—removing waste from the body through the excretory system. Water, CO2, nitrogen, salts, and heat are examples of these wastes. Metabolic rate: The rate at which the body converts food into energy. A byproduct of the body's metabolism is waste. Lungs, kidneys, liver, and skin make up the excretory system.

Disclaimer This report is intended as educational information. It is not intended to provide medical advice or be used solely by the customer in the diagnosis, cure, mitigation, treatment or prevention of disease. If you have any serious medical condition(s), including but not limited to, being over or under weight, or having diabetes or heart disease, you should not make any changes to your diet or exercise without consulting your doctor. Under no circumstances, should you make changes to your medication or other medical care without consulting your physician
